Mobile Security Assessment

How secure are your mobile applications?

Today, both customers and employees expect companies to provide mobile access to the services, data and systems they need for their everyday work. In most cases, even potentially sensitive data and business-critical systems are accessed via mobile apps. Companies therefore have to ask themselves questions such as "How secure are our apps and the related systems and data?", "Are there potential vulnerabilities that attackers could exploit?" and "How can we protect our apps?". In a mobile security assessment, we analyze your apps to provide answers to the above and other security-related questions.

Your situation

Mobile security assessments are often triggered by the need to meet compliance requirements. However, a mobile security assessment is also a good idea if you want to know what your security risks are and what you can do to reduce them.
A mobile security assessment can make sense in almost any phase of a mobile app's lifecycle, e.g. during testing, before the first going live, or after the app has been introduced in production.

Our service

When conducting a security assessment, we analyse your app for vulnerabilities and identify potential business risks. Based on the results, we propose measures to reduce the respective risks.
In our assessments, we generally follow the OWASP risk list. However, we can also focus on a specific issue or objective, or on whether your app meets company-specific require-ments.
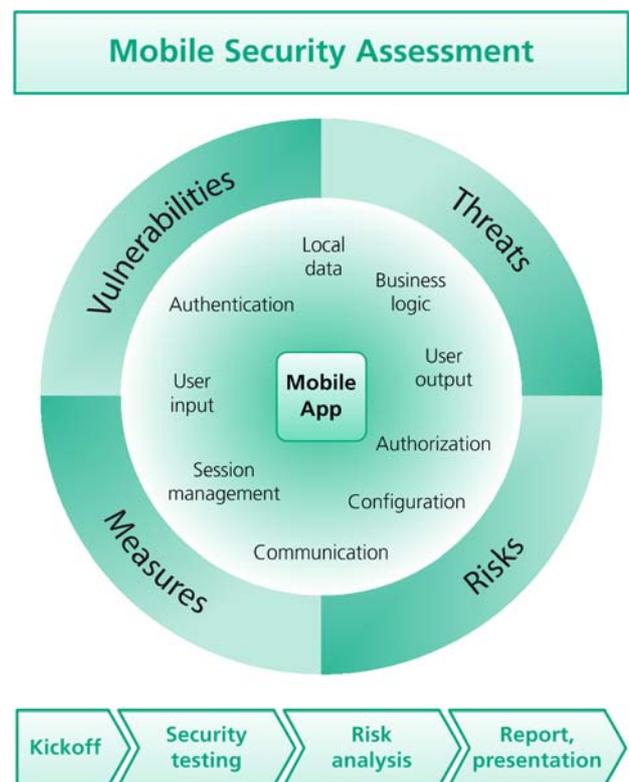

Your advantage

A mobile security assessment provides an independent and understandable analysis of the security of your mobile solution. As a company who builds business-critical applications for other companies, AdNovum is highly aware of the critical issues and vulne-rabilities involved in using mobile solutions and knows which measures can be taken to effectively counter such risks.
If required, we can also support you in specifying your requirements or in implementing the specified measures after an assess-ment. In doing so, we can help you ensure that a high security level becomes the norm for your applications.
