

Adnovum «AdExcel»

«AdExcel» turns Excel documents into a controlled part of your business, compliance and IT processes. It combines the operational and cost benefits of an Excel solution with the security and compliance of proprietary software.

It is an integral part of the «AdExcel» solution approach that data experts can continue to work with their favorite tool, Excel, while the insights gained are made available to users via existing and new web applications. For this purpose, «AdExcel» uses an individually provided application (with or without user interface) that maps all process steps upstream and downstream of the Excel solution and automates them if necessary.

The Excel files are managed in SharePoint. This ensures correct versioning, traceability and access control. There is no local file storage. Microsoft Graph API allows the application to read and write Excel files or their contents, and Office Add-ins make it possible to extend Excel based on standard web technologies.

Your benefits

- Users can continue to work with their familiar interface and take full advantage of their tool expertise.
- Relevant work steps remain the same in terms of content, but can be automated using «AdExcel».
- It is possible to meet internal and external requirements with regard to secure data processing that is traceable at all times.
- Changes to an Excel file, the calculations it contains, and data to be entered/retrieved externally are fully documented.

Solution highlights

- 100% compliant
- No local storage
- Correct versioning, traceability and access control

Integration and application

- Easy linking with existing tools and applications
- User can continue to work with Office Add-ins
- Applicable for different use cases
- Management of Excel files in Microsoft SharePoint
- Microsoft Graph API allows the application to read and write Excel files
