

Adnovum Electronic Signature

Bridge the gap: adopt legally binding digital signature to achieve complete digitalization of the customer experience.

The electronic signature is to the handwritten signature what e-mail is to the postal mail. Likewise, the electronic signature is not only a tool of digital transformation, but a fundamental component that accelerates business processes and redefines the regulatory, technological and institutional environments themselves.

Unlike other cloud-based service providers for electronic signatures, Adnovum offers a secure on-premises solution. It identifies the signing party and subsequently offers three types of signatures: simple, advanced and qualified (QES). The latter is legally binding and thus also suitable for highly demanding clients such as banks.

Your benefits

- Passwordless experience of the signature mobile app to validate signatures
- Legally binding solution supporting simple, advanced and qualified electronic signature and electronic seal
- Protection of contracts with third parties using strong encryption controlled by bank
- Sovereign solution that runs within Swiss data centers controlled by bank (not subject to Cloud Act)
- Fully digital experience, customized to bank's branding
- Signing capability is available in browser, in the mobile signature app or integrated in the bank's e-banking mobile app
- Compliance with all required legislation and control over data residency
- Possibility to enable qualified electronic signature for already onboarded bank customers

Solution highlights

- Functions in «qualified digital» signature mode without storing or exposing any Customer Identification Data (CID) to third parties, including signature service provider
- Supports multi-tenancy and granular capability of data micro-segmentation
- Covers multiple jurisdictions, including CH, EU, Singapore, HK, and the Bahamas
- Leverages the bank's existing customer onboarding process
- Runs on-premises at the client or in managed service mode

Integration and application

- Choice between a client-branded signature mobile app or a Mobile SDK allowing to integrate the digital signature functionality into the customer's digital banking applications
- Possibility of integration of the solution with a customer onboarding or any other platform
- Dedicated Identity Provider which can be interconnected with bank systems through standard protocols and federation
